Reflection on PC lab assemble lab

On 3rd December 2023, we had our PC assemble lab at Makmal Inovasi(322-02), N28, Level 3A. This was an amazing hands-on experience for us to assemble the PC and learn the procedure of assembling a PC, and get to know the components of PC.

There are a few people who guide us throughout the process, showing the procedure and making sure we did everything right. This is a very good experience as I think assemble a PC is basic knowledge for us, and knowing how the pc components work together. Navigating through the intricacies of the motherboard, CPU, GPU, RAM, and myriad other components, I found myself deciphering a digital enigma. The delicate dance of aligning pins and securing connections felt like orchestrating a symphony, where precision and attention to detail were paramount.

Embarking on the journey of assembling a PC was an immersive and rewarding experience that seamlessly blended technical prowess with a hands-on, do-it-yourself ethos. From the moment I laid out the components on a well-lit workspace, the anticipation of creating a customized computing powerhouse fueled my excitement.
